Summary

Founder of controlthrive, an AI consultancy focused on turning ambiguous business workflows into practical internal tools and first-product versions. I work directly with founders, principals, and operators to identify where automation can move the needle, scope the right solution, and ship it hands-on across product, data, and engineering.

Across client engagements, I have built systems for investor targeting, CRM intelligence, financial research, pricing, and data operations, with a strong bias toward code-first solutions that are practical, scalable, and grounded in how teams actually work. I operate as a hands-on builder who can move from ambiguous problem to production-ready tool with high ownership and low ego.

Core Strengths

- AI-native product building: LLM workflows, ranking systems, operator-facing tools, and internal automation
- Finance exposure across fintech, banking, venture and other private capital firms.
- Founder-led execution: discovery, scoping, prototyping, shipping, and iteration with end users
- Hands-on technical breadth: I've been in the trenches for +10 years.
- Working style: high ownership, high agency, code-first, customer-first, outcome always

Experience

controlthrive

Founder & Principal AI Engineer
April 2023 - Present
Amsterdam / Remote

- Founded and run a solo AI consultancy, owning the full lifecycle from discovery and problem framing to solution design, build, deployment, and ongoing iteration.
- Built Atlas, an AI-assisted investor-matching workflow for MVV Capital Partners that turns deal materials and CRM history into ranked investor shortlists with explainable reasoning. The system combines hard exclusions, champion-contact selection, weighted fit scoring, notes intelligence, exports, and human review before outreach.
- Worked closely with MVV's operators on the real mechanics of private-capital workflow design: investor taxonomy, relationship signals, contact selection, campaign handoff, CRM hygiene, and evaluation of data tools including FINTRX, Crunchbase, Clay, Parallel.ai, and relationship-intelligence options.
- Researched Clay and Parallel as enrichment and research vendors, helping the client compare a code-first, API-led approach against action-priced SaaS abstractions and make more informed decisions around flexibility, verifiability, and unit economics.
- Iterated the platform quickly in production, shipping 11 releases that improved search quality, UI review flows, CRM ingestion, export workflows, and reliability for live deal execution.
- Built an earnings-call intelligence product for a financial research workflow, combining transcript and audio processing with a React/FastAPI dashboard used by principals to offload first-pass review work from junior team members and focus them on higher-value strategic tasks across 500+ portfolio companies.
- Built a Spark-based account-matching engine that reduced 200,000 problematic records by 70% and removed more than one full-time equivalent of manual cleanup effort.
- Built a pricing engine for a SaaS commerce business that increased revenue by 35% and sales by 25%, reinforcing a product mindset grounded in measurable outcomes.

Earlier Experience

- Senior Machine Learning Engineer | Lending, Fintonic (Oct 2022 - Feb 2023): worked on fintech lending and fraud workflows with Product, UX, and Risk teams.
- Customer-Facing Data Scientist, KPMG (Jun 2022 - Oct 2022): delivered client-facing data science work with exposure to banking and enterprise analytics.
- Senior Data Scientist | Product, Minsait (Jan 2020 - Jun 2022): built machine learning solutions and presented recommendations to technical and executive stakeholders.
- Data Scientist | Consulting, PwC (Nov 2018 - Jan 2020): delivered analytics and machine learning work in consulting settings.
- Data Analyst, Orange (Oct 2017 - Nov 2018): turned complex data into operational insight for business teams.

Education

Master's Degree in Data Science
Universidad de Zaragoza
